

Standard Operating Procedure for microsatellite based bovine breed identification

1. DNA analysis from blood, tissue or extracted hairs via one of the current standard protocols.
2. Microsatellite typing by an in-house routine protocol. The following 16 markers are tested:

Markers indicated in bold are also used in the Stockmarket kit from ABI for routine parentage testing

3. Standardization of allele lengths via comparison with a reference DNA samples (see the Table below) or via a comparison of allele frequencies with the data from the EU Resgen CT98-118 project on cattle genetic diversity (European Cattle Genetic Diversity Consortium, 2006; Negrini et al., 2007). The reference animals originate from Roslin Institute, UK (RH615, Dr. P. Wiener), Giessen (GI2000, Dr. G. Erhardt) and INRA (INRA2000, Dr. K. Moazami-Goudari).

4. Analysis of the results via the program GeneClass2 (Piry et al., 2004) with in the reference database genotypes from the Resgen CT98-118 project (available on request from J.A. Lenstra, Utrecht). For calculation of specificity and sensitivity, assignments with less than 90% likelihood are considered as negatives. Samples are first assigned to breeds and on the basis of this on the group of breeds allowed and not-allowed, respectively, in a specific PGI food product.
